WEB DEVELOPMENT STANDARDS MANUAL

TechNova Solutions Pvt. Ltd.

Effective: July 2026

Coding Conventions

The **Coding Conventions** standards defined herein are mandatory for all development teams at TechNova Solutions. These guidelines ensure maintainability, scalability, and security across all web-based applications.

Article 1: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Coding Conventions that must be implemented.

- **Directive 1.1:** All development related to Coding Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.2:** All development related to Coding Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.3:** All development related to Coding Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.4:** All development related to Coding Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes.

Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 1.5:** All development related to Coding Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.6:** All development related to Coding Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.7:** All development related to Coding Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 2: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Coding Conventions that must be implemented.

- **Directive 2.1:** All development related to Coding Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.2:** All development related to Coding Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security

checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 2.3:** All development related to Coding Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.4:** All development related to Coding Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.5:** All development related to Coding Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.6:** All development related to Coding Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.7:** All development related to Coding Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 3: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Coding Conventions that must be implemented.

- **Directive 3.1:** All development related to Coding Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.2:** All development related to Coding Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.3:** All development related to Coding Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.4:** All development related to Coding Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.5:** All development related to Coding Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes.

Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 3.6:** All development related to Coding Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.7:** All development related to Coding Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 4: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Coding Conventions that must be implemented.

- **Directive 4.1:** All development related to Coding Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.2:** All development related to Coding Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.3:** All development related to Coding Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security

checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 4.4:** All development related to Coding Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.5:** All development related to Coding Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.6:** All development related to Coding Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.7:** All development related to Coding Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 5: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Coding Conventions that must be implemented.

- **Directive 5.1:** All development related to Coding Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.2:** All development related to Coding Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.3:** All development related to Coding Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.4:** All development related to Coding Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.5:** All development related to Coding Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes.

Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 5.6:** All development related to Coding Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.7:** All development related to Coding Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Naming Conventions

The **Naming Conventions** standards defined herein are mandatory for all development teams at TechNova Solutions. These guidelines ensure maintainability, scalability, and security across all web-based applications.

Article 1: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Naming Conventions that must be implemented.

- **Directive 1.1:** All development related to Naming Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.2:** All development related to Naming Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.3:** All development related to Naming Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.4:** All development related to Naming Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes.

Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 1.5:** All development related to Naming Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.6:** All development related to Naming Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.7:** All development related to Naming Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 2: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Naming Conventions that must be implemented.

- **Directive 2.1:** All development related to Naming Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.2:** All development related to Naming Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security

checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 2.3:** All development related to Naming Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.4:** All development related to Naming Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.5:** All development related to Naming Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.6:** All development related to Naming Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.7:** All development related to Naming Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 3: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Naming Conventions that must be implemented.

- **Directive 3.1:** All development related to Naming Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.2:** All development related to Naming Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.3:** All development related to Naming Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.4:** All development related to Naming Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.5:** All development related to Naming Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes.

Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 3.6:** All development related to Naming Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.7:** All development related to Naming Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 4: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Naming Conventions that must be implemented.

- **Directive 4.1:** All development related to Naming Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.2:** All development related to Naming Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.3:** All development related to Naming Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security

checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 4.4:** All development related to Naming Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.5:** All development related to Naming Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.6:** All development related to Naming Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.7:** All development related to Naming Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 5: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Naming Conventions that must be implemented.

- **Directive 5.1:** All development related to Naming Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.2:** All development related to Naming Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.3:** All development related to Naming Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.4:** All development related to Naming Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.5:** All development related to Naming Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes.

Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 5.6:** All development related to Naming Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.7:** All development related to Naming Conventions must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Folder Structure

The **Folder Structure** standards defined herein are mandatory for all development teams at TechNova Solutions. These guidelines ensure maintainability, scalability, and security across all web-based applications.

Article 1: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Folder Structure that must be implemented.

- **Directive 1.1:** All development related to Folder Structure must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.2:** All development related to Folder Structure must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.3:** All development related to Folder Structure must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.4:** All development related to Folder Structure must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes.

Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 1.5:** All development related to Folder Structure must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.6:** All development related to Folder Structure must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.7:** All development related to Folder Structure must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 2: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Folder Structure that must be implemented.

- **Directive 2.1:** All development related to Folder Structure must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.2:** All development related to Folder Structure must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security

checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 2.3:** All development related to Folder Structure must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.4:** All development related to Folder Structure must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.5:** All development related to Folder Structure must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.6:** All development related to Folder Structure must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.7:** All development related to Folder Structure must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 3: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Folder Structure that must be implemented.

- **Directive 3.1:** All development related to Folder Structure must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.2:** All development related to Folder Structure must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.3:** All development related to Folder Structure must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.4:** All development related to Folder Structure must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.5:** All development related to Folder Structure must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes.

Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 3.6:** All development related to Folder Structure must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.7:** All development related to Folder Structure must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 4: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Folder Structure that must be implemented.

- **Directive 4.1:** All development related to Folder Structure must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.2:** All development related to Folder Structure must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.3:** All development related to Folder Structure must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security

checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 4.4:** All development related to Folder Structure must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.5:** All development related to Folder Structure must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.6:** All development related to Folder Structure must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.7:** All development related to Folder Structure must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 5: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Folder Structure that must be implemented.

- **Directive 5.1:** All development related to Folder Structure must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.2:** All development related to Folder Structure must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.3:** All development related to Folder Structure must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.4:** All development related to Folder Structure must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.5:** All development related to Folder Structure must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes.

Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 5.6:** All development related to Folder Structure must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.7:** All development related to Folder Structure must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

API Standards

The **API Standards** standards defined herein are mandatory for all development teams at TechNova Solutions. These guidelines ensure maintainability, scalability, and security across all web-based applications.

Article 1: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to API Standards that must be implemented.

- **Directive 1.1:** All development related to API Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.2:** All development related to API Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.3:** All development related to API Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.4:** All development related to API Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes.

Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 1.5:** All development related to API Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.6:** All development related to API Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.7:** All development related to API Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 2: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to API Standards that must be implemented.

- **Directive 2.1:** All development related to API Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.2:** All development related to API Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security

checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 2.3:** All development related to API Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.4:** All development related to API Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.5:** All development related to API Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.6:** All development related to API Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.7:** All development related to API Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 3: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to API Standards that must be implemented.

- **Directive 3.1:** All development related to API Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.2:** All development related to API Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.3:** All development related to API Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.4:** All development related to API Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.5:** All development related to API Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes.

Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 3.6:** All development related to API Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.7:** All development related to API Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 4: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to API Standards that must be implemented.

- **Directive 4.1:** All development related to API Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.2:** All development related to API Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.3:** All development related to API Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security

checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 4.4:** All development related to API Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.5:** All development related to API Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.6:** All development related to API Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.7:** All development related to API Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 5: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to API Standards that must be implemented.

- **Directive 5.1:** All development related to API Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.2:** All development related to API Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.3:** All development related to API Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.4:** All development related to API Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.5:** All development related to API Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes.

Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 5.6:** All development related to API Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.7:** All development related to API Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

REST APIs

The **REST APIs** standards defined herein are mandatory for all development teams at TechNova Solutions. These guidelines ensure maintainability, scalability, and security across all web-based applications.

Article 1: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to REST APIs that must be implemented.

- **Directive 1.1:** All development related to REST APIs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.2:** All development related to REST APIs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.3:** All development related to REST APIs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.4:** All development related to REST APIs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject

to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 1.5:** All development related to REST APIs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.6:** All development related to REST APIs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.7:** All development related to REST APIs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 2: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to REST APIs that must be implemented.

- **Directive 2.1:** All development related to REST APIs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.2:** All development related to REST APIs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated

within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 2.3:** All development related to REST APIs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.4:** All development related to REST APIs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.5:** All development related to REST APIs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.6:** All development related to REST APIs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.7:** All development related to REST APIs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 3: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to REST APIs that must be implemented.

- **Directive 3.1:** All development related to REST APIs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.2:** All development related to REST APIs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.3:** All development related to REST APIs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.4:** All development related to REST APIs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.5:** All development related to REST APIs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 3.6:** All development related to REST APIs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.7:** All development related to REST APIs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 4: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to REST APIs that must be implemented.

- **Directive 4.1:** All development related to REST APIs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.2:** All development related to REST APIs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.3:** All development related to REST APIs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject

to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 4.4:** All development related to REST APIs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.5:** All development related to REST APIs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.6:** All development related to REST APIs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.7:** All development related to REST APIs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 5: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to REST APIs that must be implemented.

- **Directive 5.1:** All development related to REST APIs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated

within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 5.2:** All development related to REST APIs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.3:** All development related to REST APIs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.4:** All development related to REST APIs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.5:** All development related to REST APIs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.6:** All development related to REST APIs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 5.7:** All development related to REST APIs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Authentication

The **Authentication** standards defined herein are mandatory for all development teams at TechNova Solutions. These guidelines ensure maintainability, scalability, and security across all web-based applications.

Article 1: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Authentication that must be implemented.

- **Directive 1.1:** All development related to Authentication must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.2:** All development related to Authentication must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.3:** All development related to Authentication must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.4:** All development related to Authentication must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes.

Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 1.5:** All development related to Authentication must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.6:** All development related to Authentication must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.7:** All development related to Authentication must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 2: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Authentication that must be implemented.

- **Directive 2.1:** All development related to Authentication must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.2:** All development related to Authentication must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security

checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 2.3:** All development related to Authentication must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.4:** All development related to Authentication must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.5:** All development related to Authentication must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.6:** All development related to Authentication must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.7:** All development related to Authentication must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 3: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Authentication that must be implemented.

- **Directive 3.1:** All development related to Authentication must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.2:** All development related to Authentication must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.3:** All development related to Authentication must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.4:** All development related to Authentication must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.5:** All development related to Authentication must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes.

Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 3.6:** All development related to Authentication must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.7:** All development related to Authentication must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 4: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Authentication that must be implemented.

- **Directive 4.1:** All development related to Authentication must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.2:** All development related to Authentication must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.3:** All development related to Authentication must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security

checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 4.4:** All development related to Authentication must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.5:** All development related to Authentication must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.6:** All development related to Authentication must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.7:** All development related to Authentication must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 5: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Authentication that must be implemented.

- **Directive 5.1:** All development related to Authentication must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.2:** All development related to Authentication must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.3:** All development related to Authentication must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.4:** All development related to Authentication must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.5:** All development related to Authentication must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes.

Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 5.6:** All development related to Authentication must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.7:** All development related to Authentication must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Authorization

The **Authorization** standards defined herein are mandatory for all development teams at TechNova Solutions. These guidelines ensure maintainability, scalability, and security across all web-based applications.

Article 1: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Authorization that must be implemented.

- **Directive 1.1:** All development related to Authorization must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.2:** All development related to Authorization must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.3:** All development related to Authorization must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.4:** All development related to Authorization must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes.

Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 1.5:** All development related to Authorization must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.6:** All development related to Authorization must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.7:** All development related to Authorization must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 2: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Authorization that must be implemented.

- **Directive 2.1:** All development related to Authorization must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.2:** All development related to Authorization must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must

be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 2.3:** All development related to Authorization must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.4:** All development related to Authorization must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.5:** All development related to Authorization must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.6:** All development related to Authorization must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.7:** All development related to Authorization must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 3: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Authorization that must be implemented.

- **Directive 3.1:** All development related to Authorization must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.2:** All development related to Authorization must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.3:** All development related to Authorization must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.4:** All development related to Authorization must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.5:** All development related to Authorization must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 3.6:** All development related to Authorization must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.7:** All development related to Authorization must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 4: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Authorization that must be implemented.

- **Directive 4.1:** All development related to Authorization must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.2:** All development related to Authorization must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.3:** All development related to Authorization must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes.

Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 4.4:** All development related to Authorization must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.5:** All development related to Authorization must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.6:** All development related to Authorization must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.7:** All development related to Authorization must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 5: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Authorization that must be implemented.

- **Directive 5.1:** All development related to Authorization must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must

be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 5.2:** All development related to Authorization must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.3:** All development related to Authorization must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.4:** All development related to Authorization must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.5:** All development related to Authorization must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.6:** All development related to Authorization must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 5.7:** All development related to Authorization must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Accessibility

The **Accessibility** standards defined herein are mandatory for all development teams at TechNova Solutions. These guidelines ensure maintainability, scalability, and security across all web-based applications.

Article 1: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Accessibility that must be implemented.

- **Directive 1.1:** All development related to Accessibility must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.2:** All development related to Accessibility must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.3:** All development related to Accessibility must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.4:** All development related to Accessibility must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject

to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 1.5:** All development related to Accessibility must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.6:** All development related to Accessibility must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.7:** All development related to Accessibility must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 2: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Accessibility that must be implemented.

- **Directive 2.1:** All development related to Accessibility must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.2:** All development related to Accessibility must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated

within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 2.3:** All development related to Accessibility must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.4:** All development related to Accessibility must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.5:** All development related to Accessibility must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.6:** All development related to Accessibility must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.7:** All development related to Accessibility must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 3: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Accessibility that must be implemented.

- **Directive 3.1:** All development related to Accessibility must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 3.2:** All development related to Accessibility must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 3.3:** All development related to Accessibility must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 3.4:** All development related to Accessibility must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 3.5:** All development related to Accessibility must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 3.6:** All development related to Accessibility must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.7:** All development related to Accessibility must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 4: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Accessibility that must be implemented.

- **Directive 4.1:** All development related to Accessibility must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.2:** All development related to Accessibility must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.3:** All development related to Accessibility must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject

to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 4.4:** All development related to Accessibility must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.5:** All development related to Accessibility must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.6:** All development related to Accessibility must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.7:** All development related to Accessibility must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 5: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Accessibility that must be implemented.

- **Directive 5.1:** All development related to Accessibility must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated

within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 5.2:** All development related to Accessibility must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.3:** All development related to Accessibility must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.4:** All development related to Accessibility must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.5:** All development related to Accessibility must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.6:** All development related to Accessibility must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 5.7:** All development related to Accessibility must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Responsive Design

The **Responsive Design** standards defined herein are mandatory for all development teams at TechNova Solutions. These guidelines ensure maintainability, scalability, and security across all web-based applications.

Article 1: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Responsive Design that must be implemented.

- **Directive 1.1:** All development related to Responsive Design must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.2:** All development related to Responsive Design must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.3:** All development related to Responsive Design must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.4:** All development related to Responsive Design must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes.

Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 1.5:** All development related to Responsive Design must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.6:** All development related to Responsive Design must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.7:** All development related to Responsive Design must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 2: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Responsive Design that must be implemented.

- **Directive 2.1:** All development related to Responsive Design must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.2:** All development related to Responsive Design must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security

checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 2.3:** All development related to Responsive Design must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.4:** All development related to Responsive Design must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.5:** All development related to Responsive Design must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.6:** All development related to Responsive Design must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.7:** All development related to Responsive Design must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 3: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Responsive Design that must be implemented.

- **Directive 3.1:** All development related to Responsive Design must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.2:** All development related to Responsive Design must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.3:** All development related to Responsive Design must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.4:** All development related to Responsive Design must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.5:** All development related to Responsive Design must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes.

Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 3.6:** All development related to Responsive Design must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.7:** All development related to Responsive Design must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 4: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Responsive Design that must be implemented.

- **Directive 4.1:** All development related to Responsive Design must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.2:** All development related to Responsive Design must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.3:** All development related to Responsive Design must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security

checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 4.4:** All development related to Responsive Design must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.5:** All development related to Responsive Design must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.6:** All development related to Responsive Design must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.7:** All development related to Responsive Design must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 5: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Responsive Design that must be implemented.

- **Directive 5.1:** All development related to Responsive Design must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.2:** All development related to Responsive Design must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.3:** All development related to Responsive Design must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.4:** All development related to Responsive Design must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.5:** All development related to Responsive Design must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes.

Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 5.6:** All development related to Responsive Design must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.7:** All development related to Responsive Design must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Security Best Practices

The **Security Best Practices** standards defined herein are mandatory for all development teams at TechNova Solutions. These guidelines ensure maintainability, scalability, and security across all web-based applications.

Article 1: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Security Best Practices that must be implemented.

- **Directive 1.1:** All development related to Security Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.2:** All development related to Security Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.3:** All development related to Security Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.4:** All development related to Security Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes.

Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 1.5:** All development related to Security Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.6:** All development related to Security Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.7:** All development related to Security Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 2: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Security Best Practices that must be implemented.

- **Directive 2.1:** All development related to Security Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.2:** All development related to Security Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security

checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 2.3:** All development related to Security Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.4:** All development related to Security Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.5:** All development related to Security Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.6:** All development related to Security Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.7:** All development related to Security Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 3: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Security Best Practices that must be implemented.

- **Directive 3.1:** All development related to Security Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.2:** All development related to Security Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.3:** All development related to Security Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.4:** All development related to Security Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.5:** All development related to Security Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes.

Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 3.6:** All development related to Security Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.7:** All development related to Security Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 4: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Security Best Practices that must be implemented.

- **Directive 4.1:** All development related to Security Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.2:** All development related to Security Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.3:** All development related to Security Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security

checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 4.4:** All development related to Security Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.5:** All development related to Security Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.6:** All development related to Security Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.7:** All development related to Security Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 5: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Security Best Practices that must be implemented.

- **Directive 5.1:** All development related to Security Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.2:** All development related to Security Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.3:** All development related to Security Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.4:** All development related to Security Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.5:** All development related to Security Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes.

Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 5.6:** All development related to Security Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.7:** All development related to Security Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Testing

The **Testing** standards defined herein are mandatory for all development teams at TechNova Solutions. These guidelines ensure maintainability, scalability, and security across all web-based applications.

Article 1: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Testing that must be implemented.

- **Directive 1.1:** All development related to Testing must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.2:** All development related to Testing must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.3:** All development related to Testing must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.4:** All development related to Testing must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject

to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 1.5:** All development related to Testing must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.6:** All development related to Testing must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.7:** All development related to Testing must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 2: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Testing that must be implemented.

- **Directive 2.1:** All development related to Testing must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.2:** All development related to Testing must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated

within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 2.3:** All development related to Testing must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.4:** All development related to Testing must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.5:** All development related to Testing must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.6:** All development related to Testing must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.7:** All development related to Testing must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 3: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Testing that must be implemented.

- **Directive 3.1:** All development related to Testing must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 3.2:** All development related to Testing must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 3.3:** All development related to Testing must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 3.4:** All development related to Testing must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 3.5:** All development related to Testing must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 3.6:** All development related to Testing must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.7:** All development related to Testing must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 4: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Testing that must be implemented.

- **Directive 4.1:** All development related to Testing must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.2:** All development related to Testing must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.3:** All development related to Testing must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject

to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 4.4:** All development related to Testing must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.5:** All development related to Testing must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.6:** All development related to Testing must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.7:** All development related to Testing must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 5: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Testing that must be implemented.

- **Directive 5.1:** All development related to Testing must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated

within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 5.2:** All development related to Testing must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.3:** All development related to Testing must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.4:** All development related to Testing must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.5:** All development related to Testing must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.6:** All development related to Testing must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 5.7:** All development related to Testing must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Documentation

The **Documentation** standards defined herein are mandatory for all development teams at TechNova Solutions. These guidelines ensure maintainability, scalability, and security across all web-based applications.

Article 1: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Documentation that must be implemented.

- **Directive 1.1:** All development related to Documentation must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.2:** All development related to Documentation must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.3:** All development related to Documentation must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.4:** All development related to Documentation must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes.

Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 1.5:** All development related to Documentation must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.6:** All development related to Documentation must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.7:** All development related to Documentation must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 2: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Documentation that must be implemented.

- **Directive 2.1:** All development related to Documentation must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.2:** All development related to Documentation must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security

checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 2.3:** All development related to Documentation must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.4:** All development related to Documentation must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.5:** All development related to Documentation must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.6:** All development related to Documentation must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.7:** All development related to Documentation must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 3: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Documentation that must be implemented.

- **Directive 3.1:** All development related to Documentation must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.2:** All development related to Documentation must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.3:** All development related to Documentation must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.4:** All development related to Documentation must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.5:** All development related to Documentation must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes.

Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 3.6:** All development related to Documentation must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.7:** All development related to Documentation must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 4: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Documentation that must be implemented.

- **Directive 4.1:** All development related to Documentation must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.2:** All development related to Documentation must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.3:** All development related to Documentation must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security

checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 4.4:** All development related to Documentation must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.5:** All development related to Documentation must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.6:** All development related to Documentation must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.7:** All development related to Documentation must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 5: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Documentation that must be implemented.

- **Directive 5.1:** All development related to Documentation must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.2:** All development related to Documentation must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.3:** All development related to Documentation must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.4:** All development related to Documentation must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.5:** All development related to Documentation must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes.

Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 5.6:** All development related to Documentation must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.7:** All development related to Documentation must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Code Review Standards

The **Code Review Standards** standards defined herein are mandatory for all development teams at TechNova Solutions. These guidelines ensure maintainability, scalability, and security across all web-based applications.

Article 1: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Code Review Standards that must be implemented.

- **Directive 1.1:** All development related to Code Review Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.2:** All development related to Code Review Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.3:** All development related to Code Review Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.4:** All development related to Code Review Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes.

Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 1.5:** All development related to Code Review Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.6:** All development related to Code Review Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.7:** All development related to Code Review Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 2: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Code Review Standards that must be implemented.

- **Directive 2.1:** All development related to Code Review Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.2:** All development related to Code Review Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security

checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 2.3:** All development related to Code Review Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.4:** All development related to Code Review Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.5:** All development related to Code Review Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.6:** All development related to Code Review Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.7:** All development related to Code Review Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 3: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Code Review Standards that must be implemented.

- **Directive 3.1:** All development related to Code Review Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.2:** All development related to Code Review Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.3:** All development related to Code Review Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.4:** All development related to Code Review Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.5:** All development related to Code Review Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes.

Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 3.6:** All development related to Code Review Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.7:** All development related to Code Review Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 4: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Code Review Standards that must be implemented.

- **Directive 4.1:** All development related to Code Review Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.2:** All development related to Code Review Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.3:** All development related to Code Review Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security

checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 4.4:** All development related to Code Review Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.5:** All development related to Code Review Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.6:** All development related to Code Review Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.7:** All development related to Code Review Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 5: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Code Review Standards that must be implemented.

- **Directive 5.1:** All development related to Code Review Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.2:** All development related to Code Review Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.3:** All development related to Code Review Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.4:** All development related to Code Review Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.5:** All development related to Code Review Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes.

Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 5.6:** All development related to Code Review Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.7:** All development related to Code Review Standards must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Best Practices

The **Best Practices** standards defined herein are mandatory for all development teams at TechNova Solutions. These guidelines ensure maintainability, scalability, and security across all web-based applications.

Article 1: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Best Practices that must be implemented.

- **Directive 1.1:** All development related to Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.2:** All development related to Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.3:** All development related to Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.4:** All development related to Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes.

Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 1.5:** All development related to Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.6:** All development related to Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.7:** All development related to Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 2: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Best Practices that must be implemented.

- **Directive 2.1:** All development related to Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.2:** All development related to Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security

checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 2.3:** All development related to Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.4:** All development related to Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.5:** All development related to Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.6:** All development related to Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.7:** All development related to Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 3: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Best Practices that must be implemented.

- **Directive 3.1:** All development related to Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.2:** All development related to Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.3:** All development related to Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.4:** All development related to Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.5:** All development related to Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes.

Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 3.6:** All development related to Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.7:** All development related to Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 4: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Best Practices that must be implemented.

- **Directive 4.1:** All development related to Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.2:** All development related to Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.3:** All development related to Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security

checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 4.4:** All development related to Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.5:** All development related to Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.6:** All development related to Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.7:** All development related to Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 5: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to Best Practices that must be implemented.

- **Directive 5.1:** All development related to Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.2:** All development related to Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.3:** All development related to Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.4:** All development related to Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.5:** All development related to Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes.

Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 5.6:** All development related to Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.7:** All development related to Best Practices must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

FAQs

The **FAQs** standards defined herein are mandatory for all development teams at TechNova Solutions. These guidelines ensure maintainability, scalability, and security across all web-based applications.

Article 1: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to FAQs that must be implemented.

- **Directive 1.1:** All development related to FAQs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.2:** All development related to FAQs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.3:** All development related to FAQs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.4:** All development related to FAQs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject

to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 1.5:** All development related to FAQs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.6:** All development related to FAQs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 1.7:** All development related to FAQs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 2: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to FAQs that must be implemented.

- **Directive 2.1:** All development related to FAQs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.2:** All development related to FAQs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated

within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 2.3:** All development related to FAQs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.4:** All development related to FAQs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.5:** All development related to FAQs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.6:** All development related to FAQs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 2.7:** All development related to FAQs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 3: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to FAQs that must be implemented.

- **Directive 3.1:** All development related to FAQs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.2:** All development related to FAQs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.3:** All development related to FAQs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.4:** All development related to FAQs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.5:** All development related to FAQs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 3.6:** All development related to FAQs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 3.7:** All development related to FAQs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 4: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to FAQs that must be implemented.

- **Directive 4.1:** All development related to FAQs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.2:** All development related to FAQs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.3:** All development related to FAQs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject

to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 4.4:** All development related to FAQs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.5:** All development related to FAQs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.6:** All development related to FAQs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 4.7:** All development related to FAQs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Article 5: Operational Standards

Strict adherence to these standards is required for all project submissions and code reviews. This article outlines the specific requirements related to FAQs that must be implemented.

- **Directive 5.1:** All development related to FAQs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated

within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 5.2:** All development related to FAQs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.3:** All development related to FAQs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.4:** All development related to FAQs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.5:** All development related to FAQs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.
- **Directive 5.6:** All development related to FAQs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

- **Directive 5.7:** All development related to FAQs must follow the defined architectural patterns and security protocols. Any variance from these standards must be documented and approved by the Technical Lead. Performance, scalability, and security checks must be performed for every module. Documentation for these components must be updated within the central repository upon completion of any code changes. Compliance is subject to random code audits conducted by the senior engineering team. Records must be maintained for seven (7) years for compliance purposes.

Appendix: Base Prompt

Generate an official Web Development Standards Manual for TechNova Solutions Pvt. Ltd.

Length:
70â€“100 pages.

Topics:

- Coding conventions
- Naming conventions
- Folder structure
- API standards
- REST APIs
- Authentication
- Authorization
- Accessibility
- Responsive design
- Security best practices
- Testing
- Documentation
- Code review standards
- Best practices
- FAQs

Append the Base Prompt below and generate the complete document.
